COAL MINING

Presentation

This note relates to the metadata of the follow-up production account. Thus, it describes the definition, range, sources, and methodology used in preparing follow-up production accounts.

Definition

The production account of the Coal Mining industry includes the extraction of different types of mineral coal, and the processes it must undergo to become a marketable product (classification, washing, compression, and other processes).

The following variables are measured: Gross Output, Intermediate Consumption, and Value Added for the Coal Mining industry.

Source Data

Economic Surveys

• Source Name: Survey of Mining Companies.
  Reporting Institution: Coal Mining Companies. Data gathered by the Central Bank.
  Data used: Output, physical sales and valuated sales of coal.
  Frequency: Annual.

Balance Sheets and/or Financial Statements

• Source Name: Financial statements, balance sheets, and annual reports of Mining Companies.
  Reporting Institution: Coal Mining Companies.
  Data used: Mainly, Operating Income and Expenditure.
  Frequency: Annual.

Statistical Forms & Reports

• Source Name: Chilean Mining Yearbook.
  Reporting Institution: National Mining and Geology Service (Sernageomin).
  Data used: Physical Output by region.
  Publication Frequency: Annual.

Compilation method

The compilation method to transform source data into the production account consists of the following stages:

Aggregation, imputation and validation

Validations and Imputations

Information resulting from surveys is validated with the financial background information reported by companies in their balance sheets and annual reports.

The response rate for these surveys is high; therefore, imputation processes involved are minimal. When necessary, they are prepared based on financial information on income, operating costs, and accounting data for companies, disseminated by the Superintendence
Classification

The information used for preparing the Production Account of the Coal Mining industry is classified as per the International Standard Industrial Classification Rev. 3 (ISIC Rev.3). Products associated to this industry are classified in terms of the Central Product Classification (CPC).

Estimation Procedures

Generally, the procedures used for estimating the follow-up production account depend on the information sources available.

- In the benchmark compilation, every five years, there is often more complete information available; it is then possible, with the source data, to determine the “best level” for the production account components.
- There is generally less complete information for follow-up compilation. So, in order to obtain the “best-change”, prices, quantities, and values from the source data above detailed are used as indicators, whose changes are applied to the levels of the 2003 benchmark production account, by extrapolation, deflation, inflactation, and identities.

The key aspects of the calculation procedure for the main aggregate transactions or variables of the Coal Mining follow-up production account are shown below.

i) Gross Output (GO). Value at constant prices is calculated by extrapolation, using quantity indexes. Value at current prices is determined by inflactation of GO at constant prices.

ii) Intermediate consumption (IC). Value at constant prices is obtained by extrapolation, using GO at constant prices as an indicator. Value at current prices is determined by inflactation of records at constant prices.

iii) Value Added. Value at constant prices is determined by extrapolation, using GO as a single indicator. Value at current prices is obtained as the difference between the GO (at basic prices) and the IC (at purchaser prices).

Data Reconciliation

Aggregate information from Sernageomin is contrasted with the information on output from surveys. The results obtained from this account are analyzed in terms of temporal consistency, in nominal and real terms.

The aggregate Coal Mining account is submitted to the balancing processes within the supply-use table framework of follow-up production accounts.

Data Access

Publication

This industry is a component of the Rest of Mining Industry group (together with extraction of oil and natural gas, iron mining, and other mining industries) of the CBCH’s publications, except for benchmark compilation years disseminated for 73 industries.
