MANUFACTURE OF FUEL

Presentation

This note relates to the metadata of the follow-up production account. Thus, it describes the definition, range, sources, and methodology used in preparing follow-up production accounts.

Definition

This industry includes production of liquid and gas-based fuels as a result of the refining of petroleum, lube oil and grease, and other products.

The following variables are measured: Gross Output, Intermediate Consumption, and Value Added for the Manufacture of Fuel industry.

Source Data

Administrative Records

Economic Surveys

Balance Sheets and/or Financial Statements
- Source Name: FECU reporting form (Uniform Coded Statistical Record). Reporting Institution: Superintendence of Securities and Insurance (SSI). Data used: Operating income and expenditure, and depreciation of fixed assets. Frequency: Quarterly.

Other Statistics
- Source Name: Price and volume records. Reporting Institution: National Statistics Institute (NSI), National Customs Service, CBCH (Central Bank of Chile). Data used: Consumer Price Index (CPI), Wholesale Price Index (WPI), Unit Value Index (IVU), Physical production and sales index (IPVF), and imports and exports by product group. Frequency: Monthly.
Compilation Method

The compilation method to transform source data into the production account consists of the following stages:

Aggregation, imputation and validation

Validations and Imputations

Information is validated with different sources of comparison, including the Annual National Industry Survey (ENIA), income information pertinent to this industry and from specialized sources.

Classification

The information used for preparing the Production Account of this industry is classified as per the International Standard Industrial Classification Rev. 3 (ISIC Rev.3). Products associated to this industry are classified in terms of the Central Product Classification (CPC).

Estimation Procedures

Generally, the procedures used for estimating the follow-up production account depend on the information sources available.

- In the benchmark compilation, every five years, there is often more complete information available; it is then possible, with the source data, to determine the "best level" for the production account components.
- There is generally less complete information for follow-up compilation. So, in order to obtain the "best-change", prices, quantities, and values from the source data above detailed are used as indicators, whose changes are applied to the levels of the 2003 benchmark production account, by extrapolation, deflation, inflactation, and identities.

The key aspects of the calculation procedure for the main aggregate transactions or variables of the Petroleum Refining industry follow-up production account are shown below.

i) Gross Output (GO). Value at constant prices is determined by extrapolation, using volume indexes. Value at current prices is determined by inflactation.

ii) Intermediate consumption (IC). Value at constant prices is obtained by extrapolation, using GO as a single indicator. Value at current prices is determined by inflactation of records at constant prices.

iii) Value Added. Value at constant prices is determined by extrapolation, using GO as a single indicator. Value at current prices is obtained as the difference between the GO (at basic prices) and the IC (at purchaser prices).

Data Reconciliation

At a first pre-balancing stage, the results of the production account of this industry are validated with the above verification sources and with the supply of crude oil, which is mainly imported, and the supply arising from the Extraction of Petroleum industry. The results obtained are analyzed, in terms of temporal consistency, with other statistics and reports from specialized bodies, with relation to price and quantity indicators. In the same way, inter-temporal behavior of series is analyzed in both nominal and real terms.

The aggregate Manufacture of Fuels account is submitted to the balancing processes within the supply-use table framework of follow-up production accounts.
Data Access

Publication

This industry is a component of the Chemicals, Oil, Rubber and Plastic group of the CBCH's publications, except for benchmark compilation years disseminated for 73 industries.
