MANUFACTURE OF OTHER NON-METALLIC MINERALS

Presentation

This note relates to the metadata of the follow-up production account. Thus, it describes the definition, range, sources, and methodology used in preparing follow-up production accounts.

Definition

This industry includes the manufacture of refractory and non-refractory ceramics, clay products, cement, lime and plaster, concrete articles; cutting and finishing of stone and non-specific products (asphalt articles, glass wool products, etc.)

The following variables are measured: Gross Output, Intermediate Consumption, and Value Added for the Manufacture of Other Non-metallic Minerals industry.

Source Data

Administrative Records
  Data used: Operating income and expenditure, depreciation of fixed assets, and compensations.
  Frequency: Annual.

Economic Surveys
  Data used: Production, consumption, prices, inventory change.
  Frequency: Annual.
  Data used: Production and sales.
  Frequency: Monthly.

Balance Sheets and/or Financial Statements
- Source Name: Annual Reports and Balance Sheets of companies. Reporting Institution: Companies in the industry.
  Data used: Operating income and expenditure, and depreciation of fixed assets.
  Frequency: Annual.
- Source Name: FECU reporting form (Uniform Coded Statistical Record). Reporting Institution: Superintendency of Securities and Insurance (SSI).
  Data used: Operating income and expenditure, and depreciation of fixed assets.
  Frequency: Quarterly.

Other Statistics
- Source Name: Price and volume records. Reporting Institution: National Statistics Institute (NSI), National Customs Service, CBCH (Central Bank of Chile), Chilean Cement and Concrete Institute (ICH).
  Data used: Consumer Price Index (CPI), Wholesale Price Index (WPI), Unit Value
Index (IVU), and imports and exports by product group, consumption of cement and dispatches of concrete. Frequency: Monthly.

Compilation method

The compilation method to transform source data into the production account consists of the following stages:

Aggregation, imputation and validation

Validation and Imputations

The imputation process is based on the analysis of Income/Costs ratios by sub-industry and/or tier. Additionally, information relevant to the industry undergoes different statistical validations.

Classification

The information used for preparing the Production Account of this industry is classified as per the International Standard Industrial Classification Rev. 3 (ISIC Rev.3). Products associated to this industry are classified in terms of the Central Product Classification (CPC).

Estimation Procedures

Generally, the procedures used for estimating the follow-up production account depend on the information sources available.

- In the benchmark compilation, every five years, there is often more complete information available; it is then possible, with the source data, to determine the “best level” for the production account components.
- There is generally less complete information for follow-up compilation. So, in order to obtain the “best-change”, prices, quantities, and values from the source data above detailed are used as indicators, whose changes are applied to the levels of the 2003 benchmark production account, by extrapolation, deflation, infactation, and identities.

The key aspects of the calculation procedure for the main aggregate transactions or variables of the Manufacture of Other Non-metallic Minerals follow-up production account are shown below.

i) Gross Output (GO). Value at constant prices is obtained by deflation of nominal value. Value at current prices is determined by extrapolation, using value indexes.

ii) Intermediate consumption (IC). Value at constant prices is obtained by extrapolation, using GO as a single indicator. Value at current prices is determined by infactation of records at constant prices.

iii) Value Added. Value at constant prices is determined by extrapolation, using GO as a single indicator. Value at current prices is obtained as the difference between the GO (at basic prices) and the IC (at purchaser prices).

Data Reconciliation

At a first pre-balancing stage, the results of the production account of this industry are validated with the above sources of verification and with the supply of limestone from the mining industry, with self-input of cement from the industry itself, and with the imports and exports records.

The results obtained are analyzed, in terms of temporal consistency, with other statistics and reports from specialized bodies, with relation to price and quantity indicators. In the same way, inter-temporal behavior of series is analyzed in both nominal and real terms.

The aggregate Manufacture of Other Non-metallic Minerals account is submitted to
the balancing processes within the supply-use table framework of follow-up production accounts.

**Data Access**

**Publication**

This industry is a component of the Non-metallic Minerals and Base Metals group of the CBCH's publications, except for benchmark compilation years disseminated for 73 industries.
